... REYNIER'S ISOLATOR, SEEN TODAY AT A news conference.

"He said that we had all these tubes and all these tests and I'm getting tired. Why don't we just pull out all of these tubes and let me go home," Shearer said.

The end came just over two weeks after the joyous moment when David stepped out of his bubble for the first time, kissing his mother and felt the loving warmth of a human touch.

"When David died, everybody in the hospital felt it. There were tears all around. All of the family cried. A lot of the nurses cried and even some tough police officers cried," said Houston police officer Bradley L. Mills.

His family, whose last name has never been released to protect their privacy, left an hour later without comment.

"They seemed limp and exhausted," Mills said.

David left the two-room enclosure Feb. 7 because it was the only way doctors could treat flu-like symptoms attributed to an experimental bone marrow transplant he received in October from his 13-year-old sister.

David, who had talked of getting out of his bubble since the age of 3 and once

■ weeks after the joyous moment when David stepped out of his bubble for the first time, kissed his mother and felt the loving warmth of a human touch.

He was delivered by Caesarean section under extremely sterile conditions on Sept. 21, 1971, and put into a sterile incubator — the first of a series of plastic homes that grew as he did.

Everything he touched — his clothes, food, toys and books — was sterilized and passed through an airtight into the bubble.

David initially spent most of his time at the hospital, then shared time at home after a bubble was built there, along with one for the family's station wagon.

By 1991, he was spending all but two weeks a year at home. A sixth-grader at the time of his death, he attended school by telephone. He consistently got high grades, and tests showed he was brighter than average.

"It was necessary to take the calculated risk," hospital spokesman Gayl McNutt said.

But in January, David became ill for the first time in his life, developing diarrhea and vomiting.

After leaving the bubble, he developed a bleeding ulcer and began receiving blood transfusions. Other internal bleeding occurred and could not be found or stopped.

Doctors said Feb. 13 that test showed David had graft-vs-host disease, a condition in which the transplanted material attacks the body.

The boy's death was his most important contribution to medicine, Shearer said.

David apparently died of a proliferation of a type of lymphocyte — an "at normal growth" of B-cells — not from graft vs. host disease as had been believed, Shearer said.

That discovery, made after Shearer performed an autopsy, is "an unusual finding and of great medical significance," he said.

The funeral was scheduled for Saturday morning. David's family requested that it be private, the hospital said.

Psychobiotics:

Timothy G. Dinan, Catherine

Here, we define a psychobiotic as suffering from psychiatric illness. As such as gamma-aminobutyric acid and psychobiotics possess antidepressant systems. So far, psychobiotics have syndrome, where positive benefits emerging of benefits in alleviating inflammatory actions of certain psych scale placebo-controlled studies are

List of Symposia

- Delineating the Neural Circuits Underlying Serotonin Modulation of Fear and Anxiety.
- 5-HT_{1F} Receptor Agonists, The New Kids On The Block for Antimigraine Treatment.
 - Serotonin Transport Proteins in Ecstasy; SERTS and OCTS in a Frenzy.
 - Lucky 7 (5-HT₇ Receptor): New Functions for a (relatively) New Colleague.
- Delving Deep into 5-HT Neurons: Probing Patterns and Regulation of 5-HT Transcriptomes and Translatomes.
 - Improving our Understanding of Serotonin in the Neurobiology of Psychosis.
 - Towards a Multiscale, Multispecies Perspective of Serotonergic Function.
 - Serotonin, Inflammation and Behaviour.
 - The Role of Serotonin in Synaptic Structure and Plasticity.
- Multilevel Assembly of Serotonin Circuits and Its Impact on Emotional and Motivated Behaviors.
 - Serotonin Regulation of Dendritic Spines.
- Serotonin and Mental Illness: From Brain Development to Adult Dysfunction.
 - Feedback Control of Serotonin in Behavior and Antidepressant Response.
 - Serotonin and Autism Spectrum Disorder Hyperserotonemia and Beyond.

Special Session 1

Gut-Brain-Microbiome Axis

- Impact of Serotonin at the Microbial & Immune Interface on Gut-Brain Signalling.
 - Serotonin as a Modulator of the Gut-Brain-Microbiome Axis in Depression and other Mental Health Disorders.
- Serotonin Revisited – New Insights in Disturbed Functions in the Gastrointestinal Tract

Special Session 2

5-HT Receptor Signaling and Heteromerization

- Novel Functional Crosstalk and Heterodimerization of Serotonin Receptors in Mood and Social Behaviour.
 - Serotonin Receptor Complexes as Key Players in CNS Function.
- Three Crucial Factors that Underpin 5-HT_{2C} Function: Location, Location, Location.
