NEOČEKÁVANÉ OBTÍŽNÉ ZAJIŠTĚNÍ DC U DOSPĚLÉHO

OČEKÁVÁNÉ OBTÍŽNÉ ZAJIŠTĚNÍ DC U DĚtí

Effect of a protective-ventilation strategy on mortality in the acute respiratory distress syndrome

M.B Amato, C.S Barbas, D.M Medeiros, et al., N Engl J Med. 1998

Conventional ventilation

- lowest PEEP for acceptable oxygenation
- Vt 12 ml /kg IBW
- Normal PaCO₂

Protective ventilation

- end-expiratory pressures above the lower inflection point
- Vt 6 ml/ kg IBW
- driving pressures max 20 cmH₂O above PEEP
- permissive hypercapnia
- pressure-limited ventilatory modes

Effect of a protective-ventilation strategy on mortality in the acute respiratory distress syndrome

M.B Amato, C.S Barbas, D.M Medeiros, et al., N Engl J Med. 1998

Conventional ventilation

Protective ventilation

Conclusions: As compared with conventional ventilation, the protective strategy was associated with improved survival at 28 days, a higher rate of weaning from mechanical ventilation, and a lower rate of barotrauma in patients with the acute respiratory distress syndrome. Protective ventilation was not associated with a higher rate of survival to hospital discharge.

Ventilation with lower tidal volumes as compared with traditional tidal volumes for acute lung injury and the ARDS

Acute Respiratory Distress Syndrome Network, N Engl J Med. 2000

Traditional ventilation

- Vt 12 ml/kg IBW
- plateau pressure of 50 cmH₂O or less

Protective ventilation

- Vt 6 ml/ kg IBW
- plateau pressure of 30 cmH₂O or less

Results: The trial was stopped after the enrollment of 861 patients because mortality was lower in the group treated with lower tidal volumes than in the group treated with traditional tidal volumes

Ventilation with lower tidal volumes as compared with traditional tidal volumes for acute lung injury and the ARDS

Acute Respiratory Distress Syndrome Network, N Engl J Med. 2000

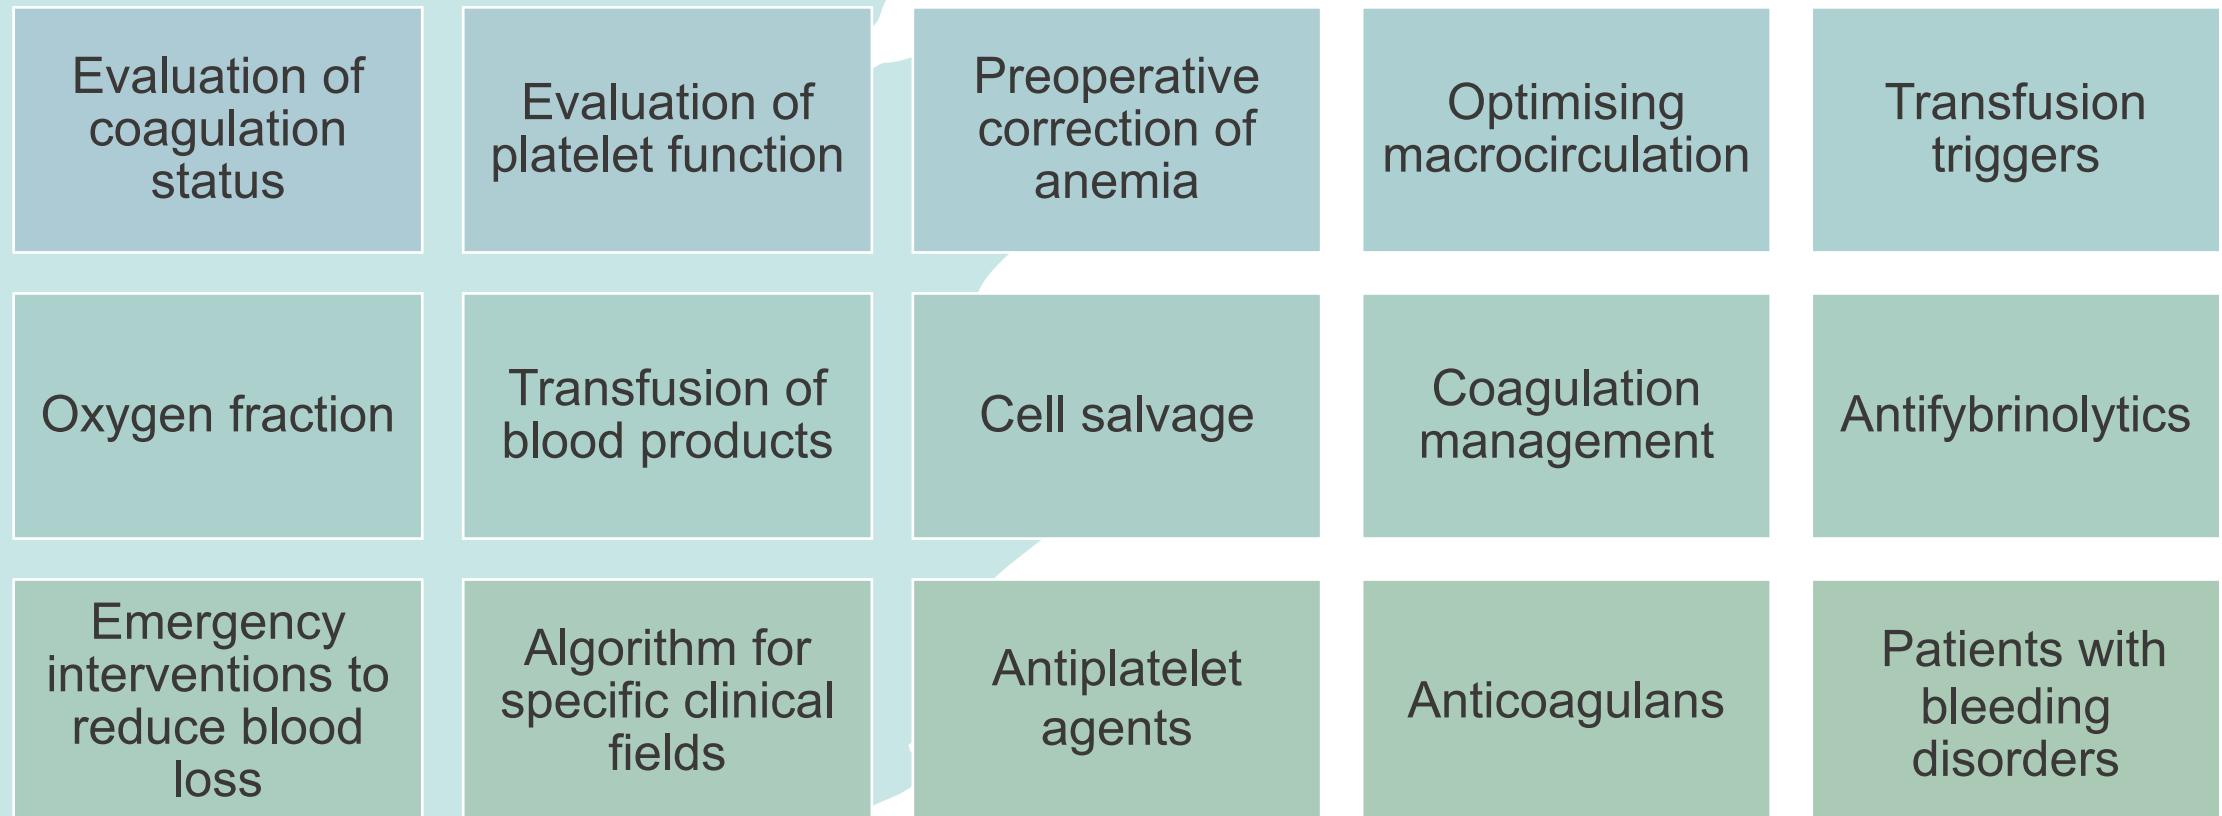

Traditional ventilation

Protective ventilation

Conclusions: In patients with acute lung injury and the acute respiratory distress syndrome, mechanical ventilation with a lower tidal volume than is traditionally used results in decreased mortality and increases the number of days without ventilator use.

Management of severe perioperative bleeding: Guidelines from the European Society of Anaesthesiology First update 2016

Kozek-Langenecker, Sibylle A.; Ahmed, Aamer B, et al., Eur J Anaesthesiol 2017

The European guideline on management of major bleeding and coagulopathy following trauma: fifth edition

D.R Spahn, B. Bouillon, V. Cerny, et al. Critical Care, 2019

Key messages

Quick transport and treatment by a specialised trauma centre

Monitor and support coagulation as early as possible and use to guide a goal-directed treatment

Coagulation support and thromboprophylaxis in trauma patients pre-treated with anticoagulants or platelet inhibitors.

A damage-control approach to surgical intervention guides patient management

Local adherence to a multidisciplinary, evidence-based treatment protocol that undergoes regular quality assessment

The European guideline on management of major bleeding and coagulopathy following trauma: fifth edition

D.R Spahn, B. Bouillon, V. Cerny, et al. Critical Care, 2019

- Tranexamic acid
- Fibrinogen
- Goal-directed coagulation management (labs and/or VEM)

Surviving Sepsis Campaign Guidelines 2021

Sepsis and septic shock are medical emergencies, and we recommend that treatment and resuscitation begin immediately.

Initial Resuscitation

Best Practice

Treatment & Resuscitation (if time fits please use)

We recommend against using qSOFA compared with SIRS, NEWS, or MEWS as a single screening tool for sepsis or septic shock.

Quality of evidence: Moderate

Screening

Strong

Screening Tools

For adults with sepsis or septic shock, we recommend using crystalloids as first-line fluid for resuscitation.

Quality of evidence: Moderate

Hemodynamic Management

Strong

Fluid Resuscitation

Early Goal-Directed Therapy in the Treatment of Severe Sepsis and Septic Shock

E.Rivers, B.Nguyen, S. Havstad, et al. 2001

Goal:

efficacy of early goal-directed therapy before admission to the intensive care unit (6 hours)

Primary outcome: in hospital mortality

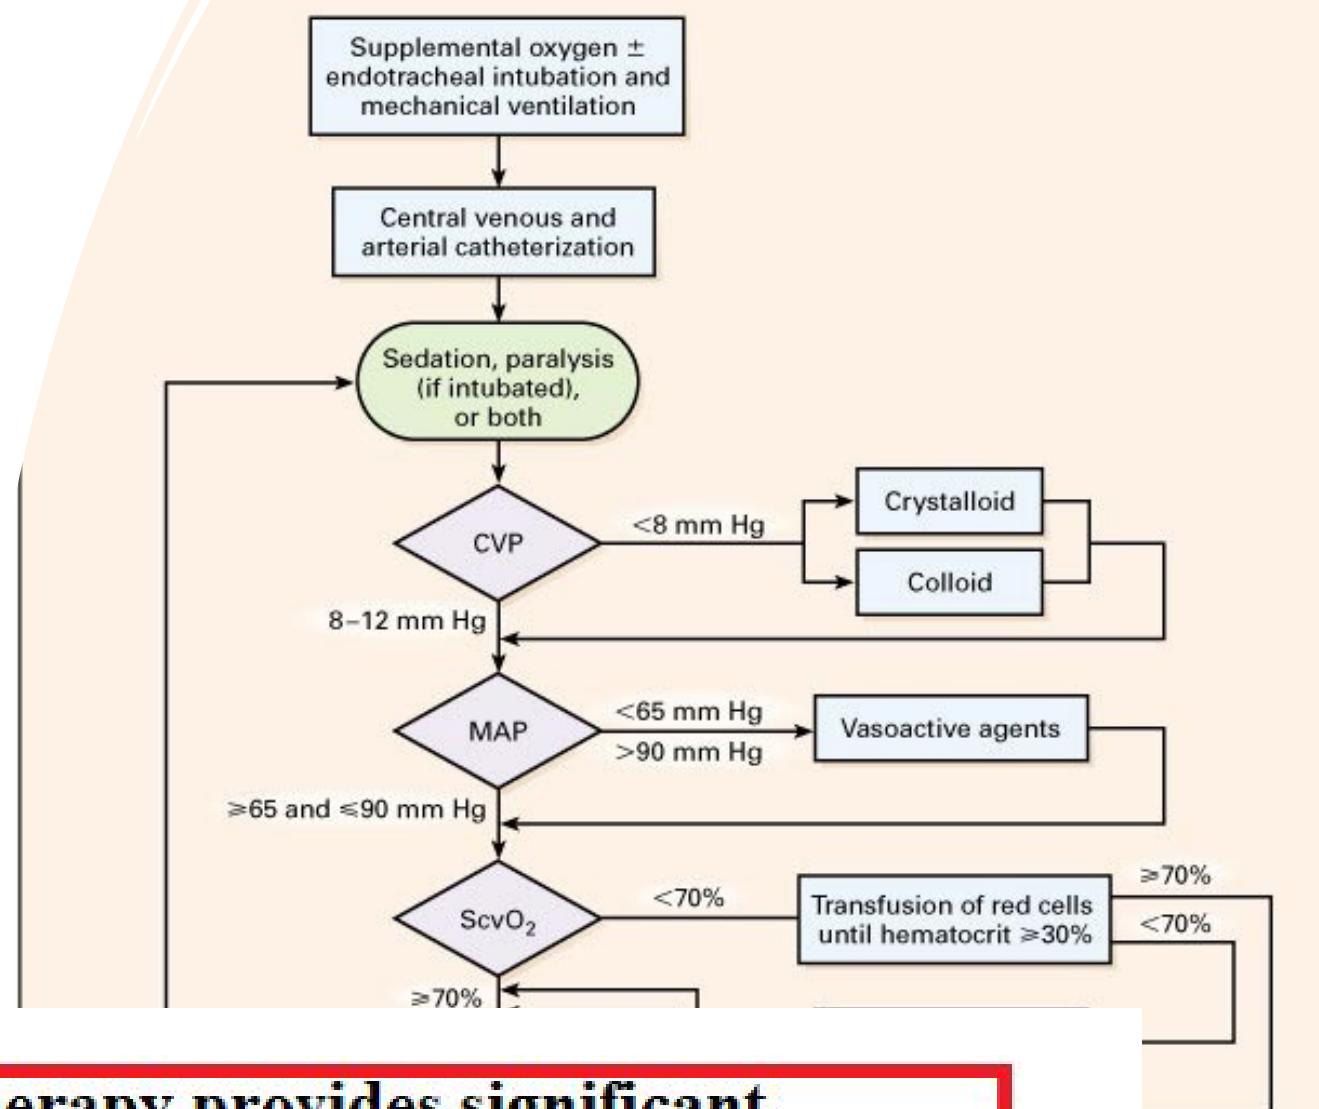

Early Goal-Directed Therapy in the Treatment of Severe Sepsis and Septic Shock

E.Rivers, B.Nguyen, S. Havstad, et al. 2001

Goal:

efficacy of early goal-directed therapy before admission to the intensive care unit (6 hours)

Primary outcome: in hospital

Conclusion: Early goal-directed therapy provides significant benefits with respect to outcome in patients with severe sepsis and septic shock

Consensus on circulatory shock and hemodynamic monitoring. Task force of the European Society of Intensive Care Medicine

M.Cecconi, D. de Backer, M. Antonelli, et al., Intensive Care Med. 2014

- (1) What are the **epidemiologic** and **pathophysiologic** features of shock in the intensive care unit?
- (2) Should we **monitor preload and fluid responsiveness** in shock?
- (3) How and when should we **monitor stroke volume or cardiac output** in shock?
- (4) What **markers** of the **regional and microcirculation** can be monitored, and how can cellular function be assessed in shock?
- (5) What is the **evidence** for using **hemodynamic monitoring to direct therapy** in shock?

Intensive insulin therapy in critically ill patients

G van den Berge, P. Wouters, F. Weekers et al., N Engl J Med. 2001

- intensive insulin therapy
(blood glucose 4.4- 6.1 mmol/l)
- conventional treatment
(insulin only if glucose over 11.9 mmol/l,
maintenance between 10.0 and 11.1 mmol/l)

Conclusions: Intensive insulin therapy to maintain blood glucose at or below 110 mg per deciliter reduces morbidity and mortality among critically ill patients in the surgical intensive care unit.

Intensive versus Conventional Glucose Control in Critically Ill Patients

The NICE-SUGAR Study Investigators, N Engl J Med 2009

- intensive glucose control
(blood glucose 4.5 to 6.0 mmol/l)
- conventional glucose control,
(blood glucose 10.0 mmol/l or less)

Intensive insulin therapy in critically ill patients

G van den Berge, P. Wouters, F. Weekers et al., N Engl J Med. 2001

- intensive insulin therapy
(blood glucose 4.4- 6.1 mmol/l)
- conventional treatment
(insulin only if glucose over 11.9 mmol/l,
maintenance between 10.0 and 11.1 mmol/l)

CONCLUSIONS

In this large, international, randomized trial, we found that intensive glucose control increased mortality among adults in the ICU: a blood glucose target of 180 mg or less per deciliter resulted in lower mortality than did a target of 81 to 108 mg per deciliter.

Intensive versus Conventional Glucose Control in Critically Ill Patients

The NICE-SUGAR Study Investigators, N Engl J Med 2009

- intensive glucose control
(blood glucose 4.5 to 6.0 mmol/l)
- conventional glucose control,
(blood glucose 10.0 mmol/l or less)

Clinical Practice Guidelines for the Prevention and Management of Pain, Agitation/Sedation, Delirium, Immobility, and Sleep Disruption in Adult Patients in the ICU

J.W.Devlin, Y. Skrobik, C.Gélinas et al., Crit Care Med.2018

Pain - multimodal analgesia therapy, validated pain scales

Sedation - light over deep sedation, propofol or dexmedetomidine **over** benzodiazepine

Delirium - CAM-ICU, ICDSC risk factors, therapy

Immobilisation - indicators for starting/stopping rehabilitation sessions

Sleep (disruption) - delirium link

2022 Society of Critical Care Medicine Clinical Practice Guidelines on Prevention and Management of Pain, Agitation, Neuromuscular Blockade, and Delirium in Critically Ill Pediatric Patients With Consideration of the ICU Environment and Early Mobility

H. A B SMith, J. B Besunder, K. A Betters, et al. Pediatr Crit Care Med. 2022

Strong recommendations and good practice:

- Age adjusted scoring systems
- Dexmedetomidine as a primary sedative at PICU
- Minimizing benzodiazepine-based sedation when feasible
- Routine screening for ICU delirium
- Check and treat iatrogenic Withdrawal Syndrome

ESPEN guideline on clinical nutrition in the intensive care unit

P.Singer, A. R. Blasser, M. M Berger, Clin Nutr . 2019

- who are the patients at risk
- how to assess nutritional status
- define the amount of energy to provide
- route to choose and how to adapt it
- when to start and how to progress in nutrition administration
- determination of amount and nature of carbohydrates, fat and protein
